

# Instagram User Analytics

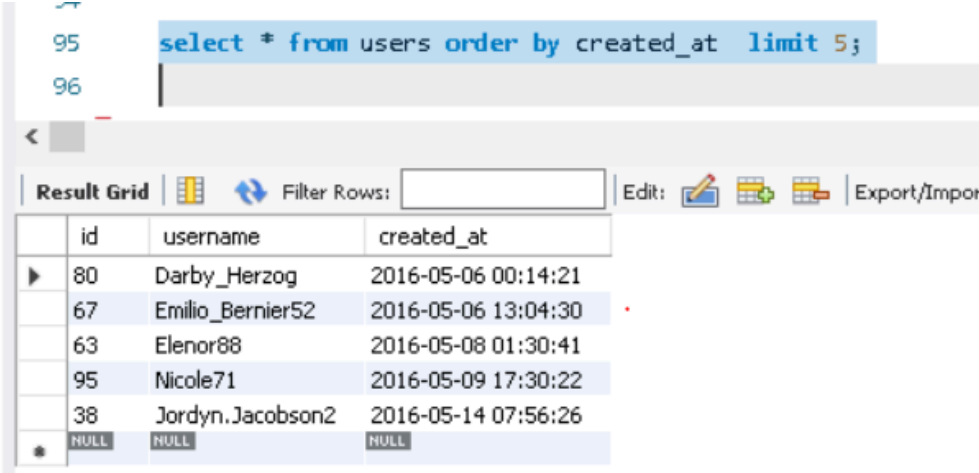

## SUMMARY :

This project provides a comprehensive analysis of user engagement and behavior on Instagram. The marketing analysis section helps in identifying key user groups and trends, such as the most loyal users, inactive users, contest winners, popular hashtags, and the best day for launching ad campaigns. The investor metrics section focuses on user engagement and identifying potential fake accounts, providing valuable insights for platform optimization and user retention strategies.

## ANSWERS :

### A) Marketing Analysis:

1. **Loyal User Reward:** The marketing team wants to reward the most loyal users, i.e., those who have been using the platform for the longest time.  
Your Task: Identify the five oldest users on Instagram from the provided database.

The screenshot shows a SQL query editor with the following query:

```
select * from users order by created_at limit 5;
```

Below the query editor, a "Result Grid" displays the results of the query. The grid has three columns: "id", "username", and "created\_at". The results are as follows:

	id	username	created_at
▶	80	Darby_Herzog	2016-05-06 00:14:21
	67	Emilio_Bernier52	2016-05-06 13:04:30
	63	Elenor88	2016-05-08 01:30:41
	95	Nicole71	2016-05-09 17:30:22
	38	Jordyn.Jacobson2	2016-05-14 07:56:26
*	NULL	NULL	NULL

Explanation:

**ORDER BY created\_at ASC:** This sorts the users in ascending order based on the created\_at timestamp, meaning the oldest users come first.

**LIMIT 5:** This restricts the result set to the first five rows, which correspond to the five oldest users.

2. **Inactive User Engagement:** The team wants to encourage inactive users to start posting by sending them promotional emails.

Your Task: Identify users who have never posted a single photo on Instagram.

```
98
99 • SELECT t1.id, t1.username
100 FROM users t1
101 LEFT JOIN photos t2 ON t1.id = t2.user_id
102 WHERE t2.user_id IS NULL;
103
104
105
```

Result Grid

	id	username
▶	5	Aniya_Hackett
	7	Kassandra_Homenick
	14	Jaclyn81
	21	Rocio33
	24	Maxwell.Halvorson
	25	Tierra.Trantow
	34	Pearl7
	36	Ollie_Ledner37
	41	Mckenna17

Result 6 x

Explanation:

In user table there will be all the ids of the user and in photos only those user will be there who have added photos so we have to find those user id which is not present in photos 's user id

3. **Contest Winner Declaration:** The team has organized a contest where the user with the most likes on a single photo wins.

Your Task: Determine the winner of the contest and provide their details to the team.

user id In this question as mentioned most likes on single photo so in likes table i have photo\_id and user\_id , at first i tried to find out any duplicates i wanted to search for multiple entries for one single user and with same photo id so that i can count the likes the for a

single photo but in likes table i have distinct photo\_id only so i have count of one single user with distinct photos

```
107 select min(created_at) from users where created_at = ();
108
109 select min(created_at) from users where created_at = ();
110
111 photos(image_url, user_id)
112 likes(user_id, photo_id)
113 select count(*), user_id, photo_id from likes group by user_id, photo_id having count(*) > 1;
114
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: |

count(*)	user_id	photo_id
----------	---------	----------

No duplicates

```
126 SELECT MAX(like_count) AS max_like_count, user_id
127 FROM (
128     SELECT COUNT(DISTINCT photo_id) AS like_count, user_id
129     FROM likes
130     GROUP BY user_id
131     HAVING COUNT(DISTINCT photo_id) > 1
132 ) AS subquery
133 GROUP BY user_id
134 ORDER BY max_like_count DESC
135 LIMIT 1;
136
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: | Fetch rows: |

max_like_count	user_id
257	5

In this subquery i found the distinct photo id with the same user id and counted the the number given alisa as likes\_count and in outer query i found the max of likes count with the user\_id order by desc max\_like\_count so max will come first and limit 1 to give one row of max one

4. **Hashtag Research:** A partner brand wants to know the most popular hashtags to use in their posts to reach the most people.  
Your Task: Identify and suggest the top five most commonly used hashtags on the platform.

In this i will try to find the count user used each tags i.e per tag how many users then i will find the top 5 of it and display it

To find the count of user per tag i will use it as subquery and in outer query and limit to max 5 and in outer query will find the tags by using the tag id from inner query

#### INNER QUERY :

```
151
152 • select tag_name from tags where id in (
153   select tag_id from(
154     SELECT pt.tag_id, COUNT(DISTINCT p.user_id) AS user_count
155     FROM photos p
156     JOIN photo_tags pt ON p.id = pt.photo_id
157     GROUP BY pt.tag_id
158     HAVING COUNT(DISTINCT user_id) > 1
159     order by count(distinct user_id) desc limit 5)as sub
160   ) ;
```

Result Grid			Filter Rows:	Export:	Wrap Cell Content:	Fel
	tag_id	user_count				
▶	21	37				
	20	33				
	17	29				
	13	26				
	18	21				

## FULL QUERY RESULT :

The screenshot shows a SQL query editor with a query spanning lines 152 to 160. The query is a nested SELECT statement that finds tags with more than one distinct user. Below the query editor, the 'Result Grid' shows the output of the query, which is a list of tag names: smile, beach, party, fun, and concert. The interface includes a 'Filter Rows' field, an 'Export' button, and a 'Wrap Cell Content' option.

```
150
151
152 • select tag_name from tags where id in (
153   select tag_id from(
154     SELECT pt.tag_id, COUNT(DISTINCT p.user_id) AS user_count
155     FROM photos p
156     JOIN photo_tags pt ON p.id = pt.photo_id
157     GROUP BY pt.tag_id
158     HAVING COUNT(DISTINCT user_id) > 1
159     order by count(distinct user_id) desc limit 5)as sub
160   ) ;
```

Result Grid

tag_name
smile
beach
party
fun
concert

Rows 28

5. **Ad Campaign Launch:** The team wants to know the best day of the week to launch ads.

Your Task: Determine the day of the week when most users register on Instagram.

Provide insights on when to schedule an ad campaign.

```
186
187
188 • SELECT
189     DAYNAME(created_at) AS day_of_week,
190     COUNT(*) AS registration_count
191 FROM
192     users
193 GROUP BY
194     DAYNAME(created_at)
195 ORDER BY
196     registration_count DESC;
```

<

Result Grid   Filter Rows:  Export:  Wrap Cell Content: 

	day_of_week	registration_count
▶	Thursday	16
	Sunday	16
	Friday	15
	Tuesday	14
	Monday	14
	Wednesday	13
	Saturday	12

Result 32 ×

## B) Investor Metrics:

**1. User Engagement:** Investors want to know if users are still active and posting on Instagram or if they are making fewer posts.

Your Task: Calculate the average number of posts per user on Instagram. Also, provide the total number of photos on Instagram divided by the total number of users.

```
81 • select round(avg(photo_id)) as avg_post, user_id from likes group by user_id ;
82
83 • SELECT
84     (SELECT COUNT(*) FROM photos) / (SELECT COUNT(*) FROM users) AS average_posts_per_user
85
86
87
88
89
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: [IA](#)

	avg_post	user_id
▶	126	2
	124	3
	124	4
	129	5
	120	6
	129	8
	125	9
	122	10

```
1 • select round(avg(photo_id)) as avg_post, user_id from likes group by user_id ;
2
3 • SELECT
4     (SELECT COUNT(*) FROM photos) / (SELECT COUNT(*) FROM users) AS average_posts_per_user;
5
6
7
8
9
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: [IA](#)

average_posts_per_user
2.5700

**2. Bots & Fake Accounts:** Investors want to know if the platform is crowded with fake and dummy accounts.

Your Task: Identify users (potential bots) who have liked every single photo on the site, as this is not typically possible for a normal user.

First i found the user id from likes tables i.e like count of every user and i found the total number of photos and matched the user's total likes count with total photo if matched it is a bot i.e that user liked every photo

```
106
107
108 • select username from users where id in (
109 • select user_id from (
110 • select count(distinct t.photo_id) as likes_count ,t.user_id from likes t join
111 • photos p on t.photo_id = p.id group by t.user_id having count(distinct t.photo_id) = (select count(*) from photos)
112 • order by count(distinct t.photo_id) desc ) as sub);
113
114
115
116
117 • group by user_id;
118 • select count(*) from photos;
```
